CONTEXT

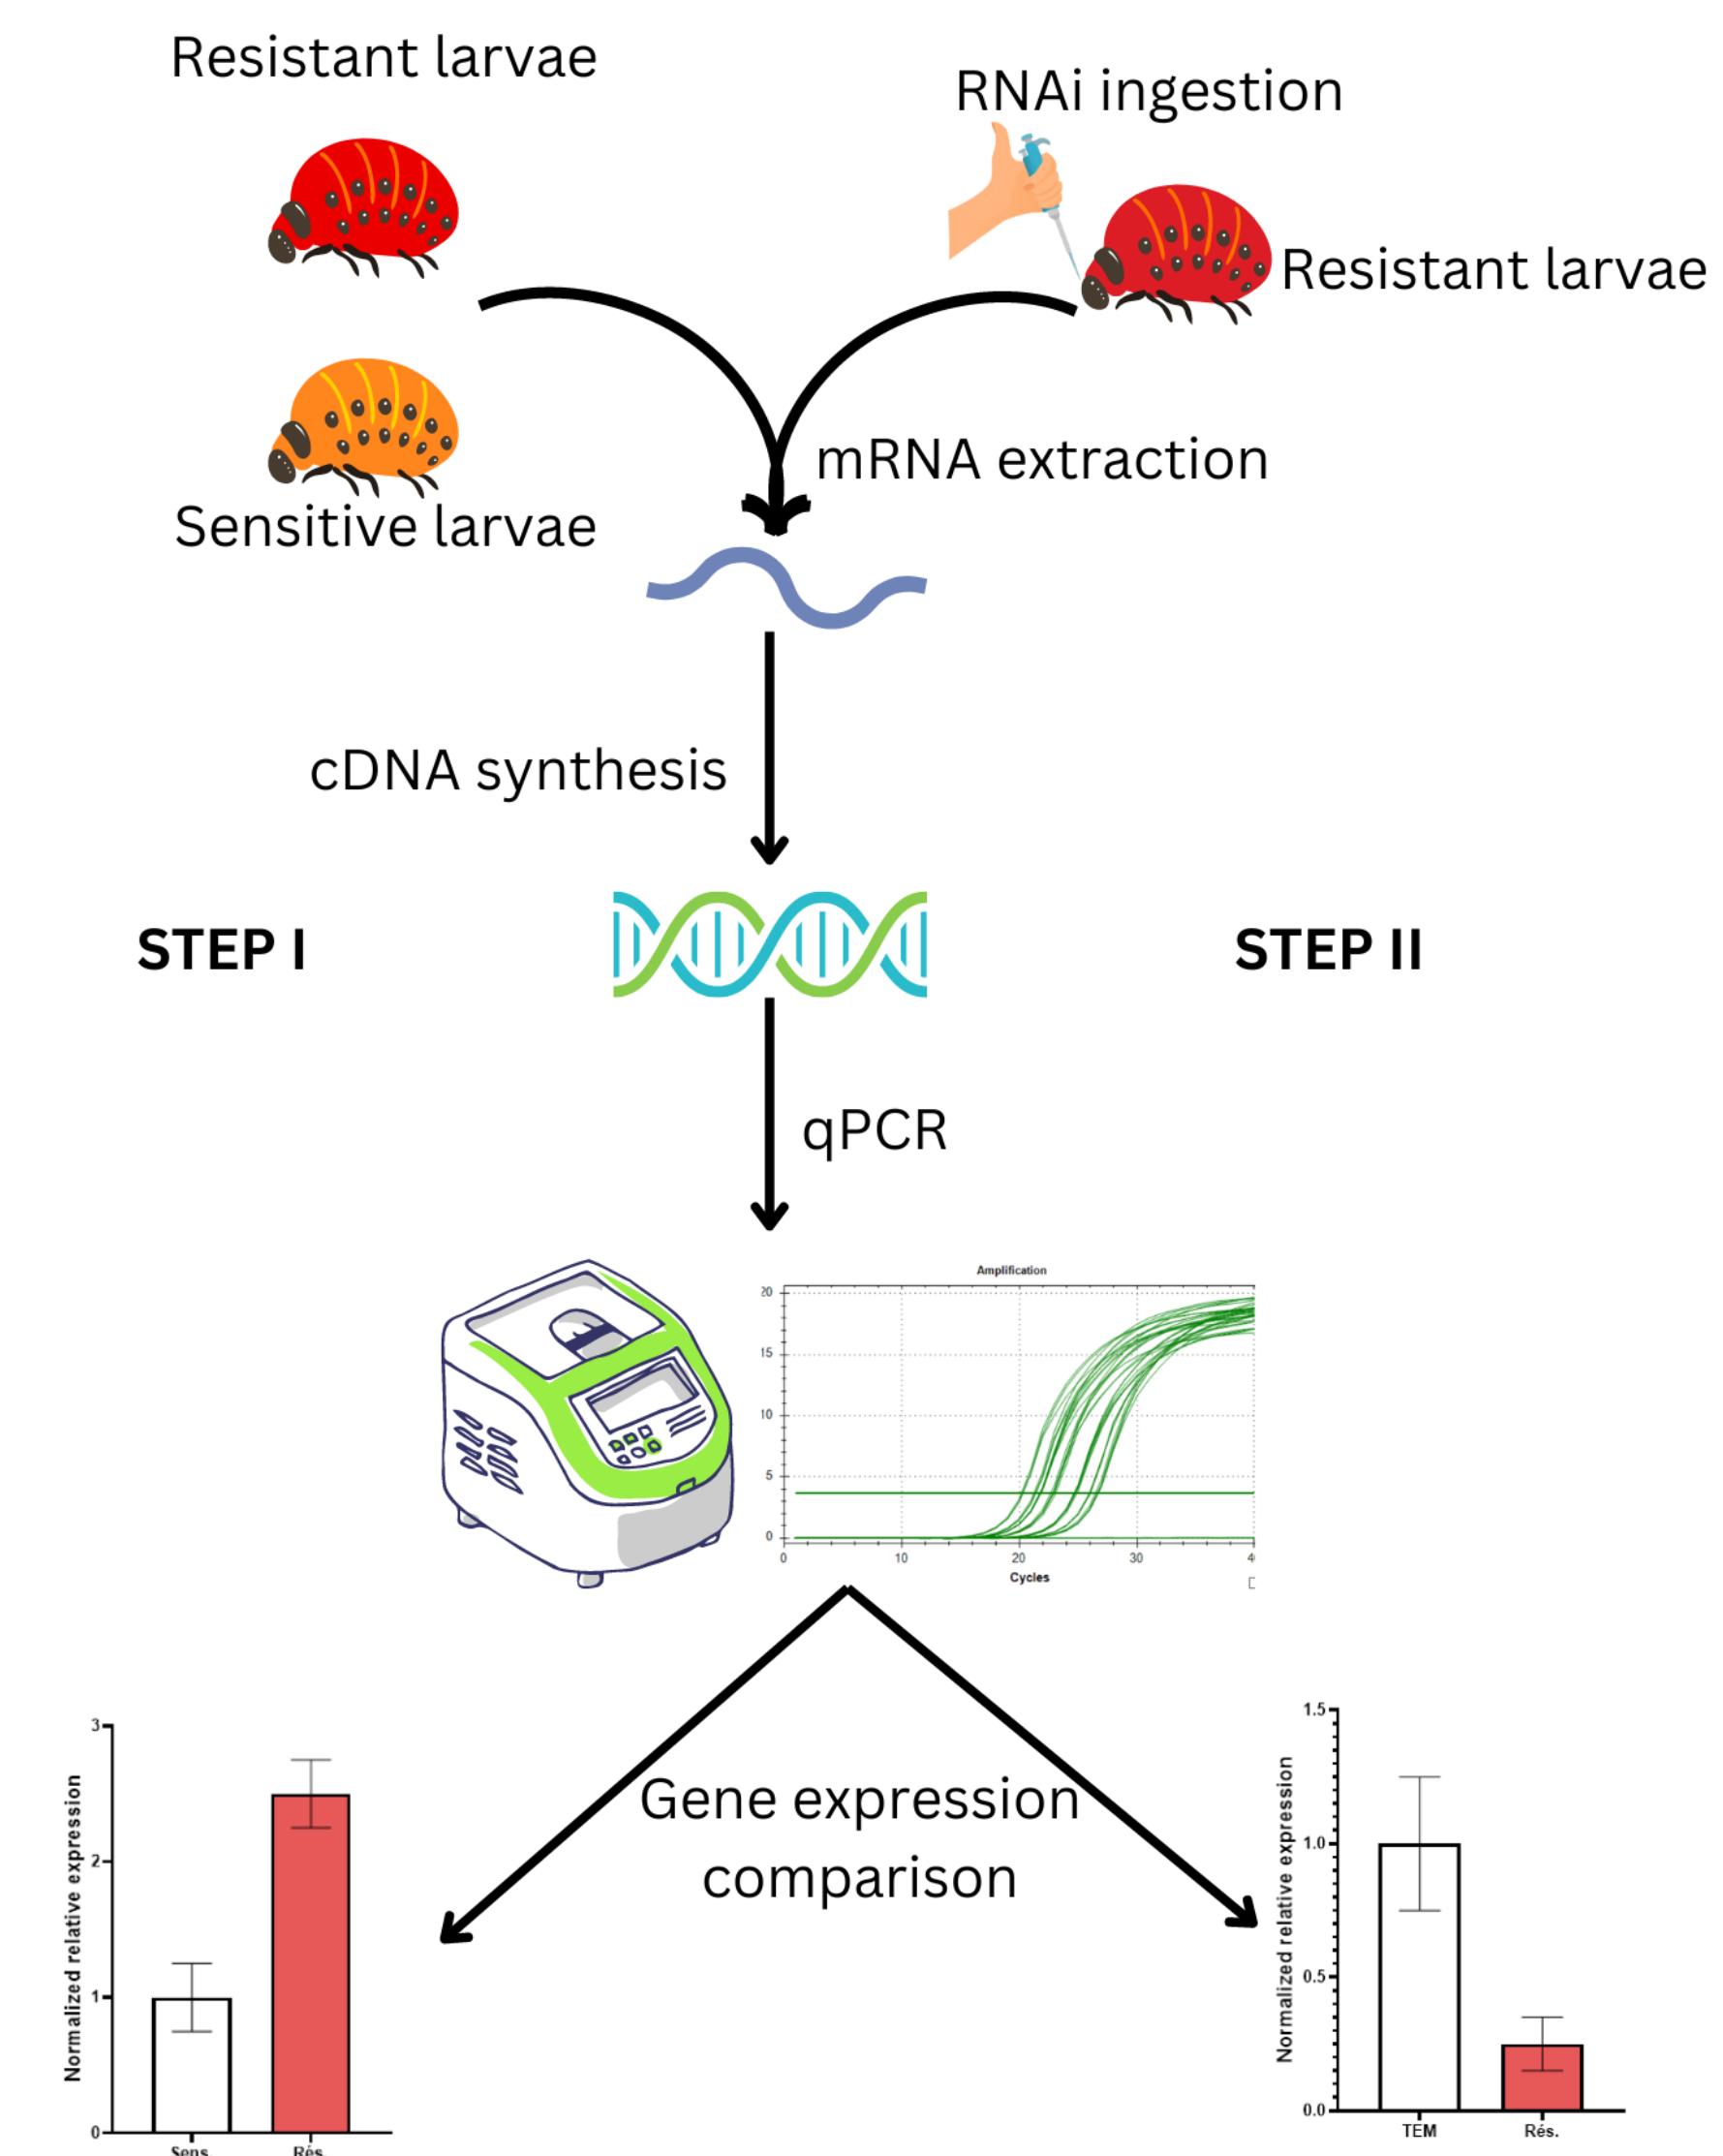

- The overexpression of detoxification genes as CYP450 and GST allows insect to develop insecticide resistance
- The Colorado potato beetle (CPB) is one of twelve resistant pest in the world, able to resist to more 52 active ingredients
- CPB = 74 CYP450 and 27 GST

OBJECTIVES

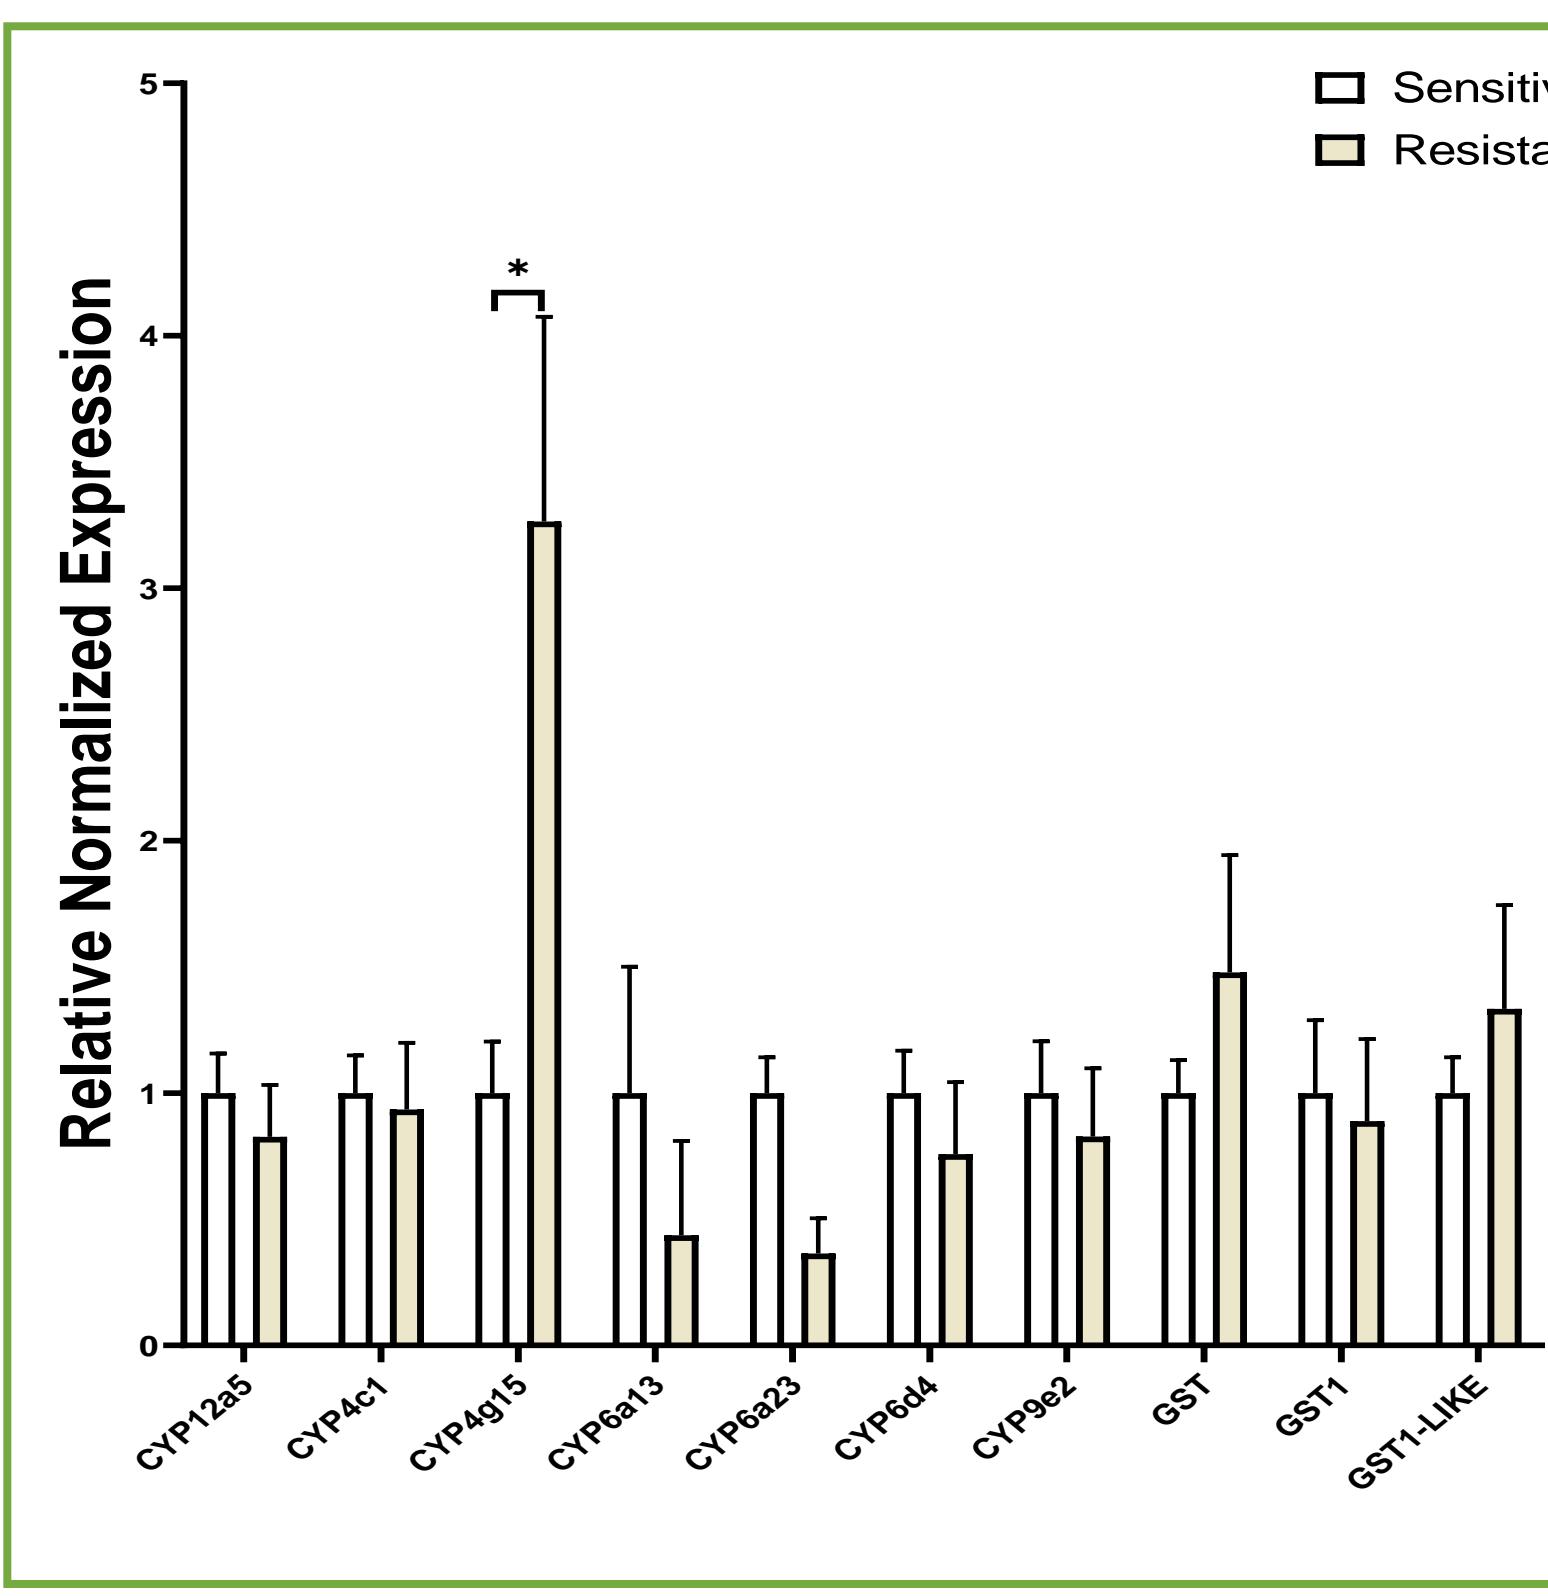

- Comparison of gene expression between sensitive and resistant field strains.
- The genes are **7 CYP450 and 3 GST**.
- Quantification of target gene expression by RT-qPCR.
- Demonstrating the efficacy of RNAi.

METHODOLOGIES

Comparison between sensitive and resistant populations

11 wild populations exposed to 9 insecticides from 4 chemical groups.

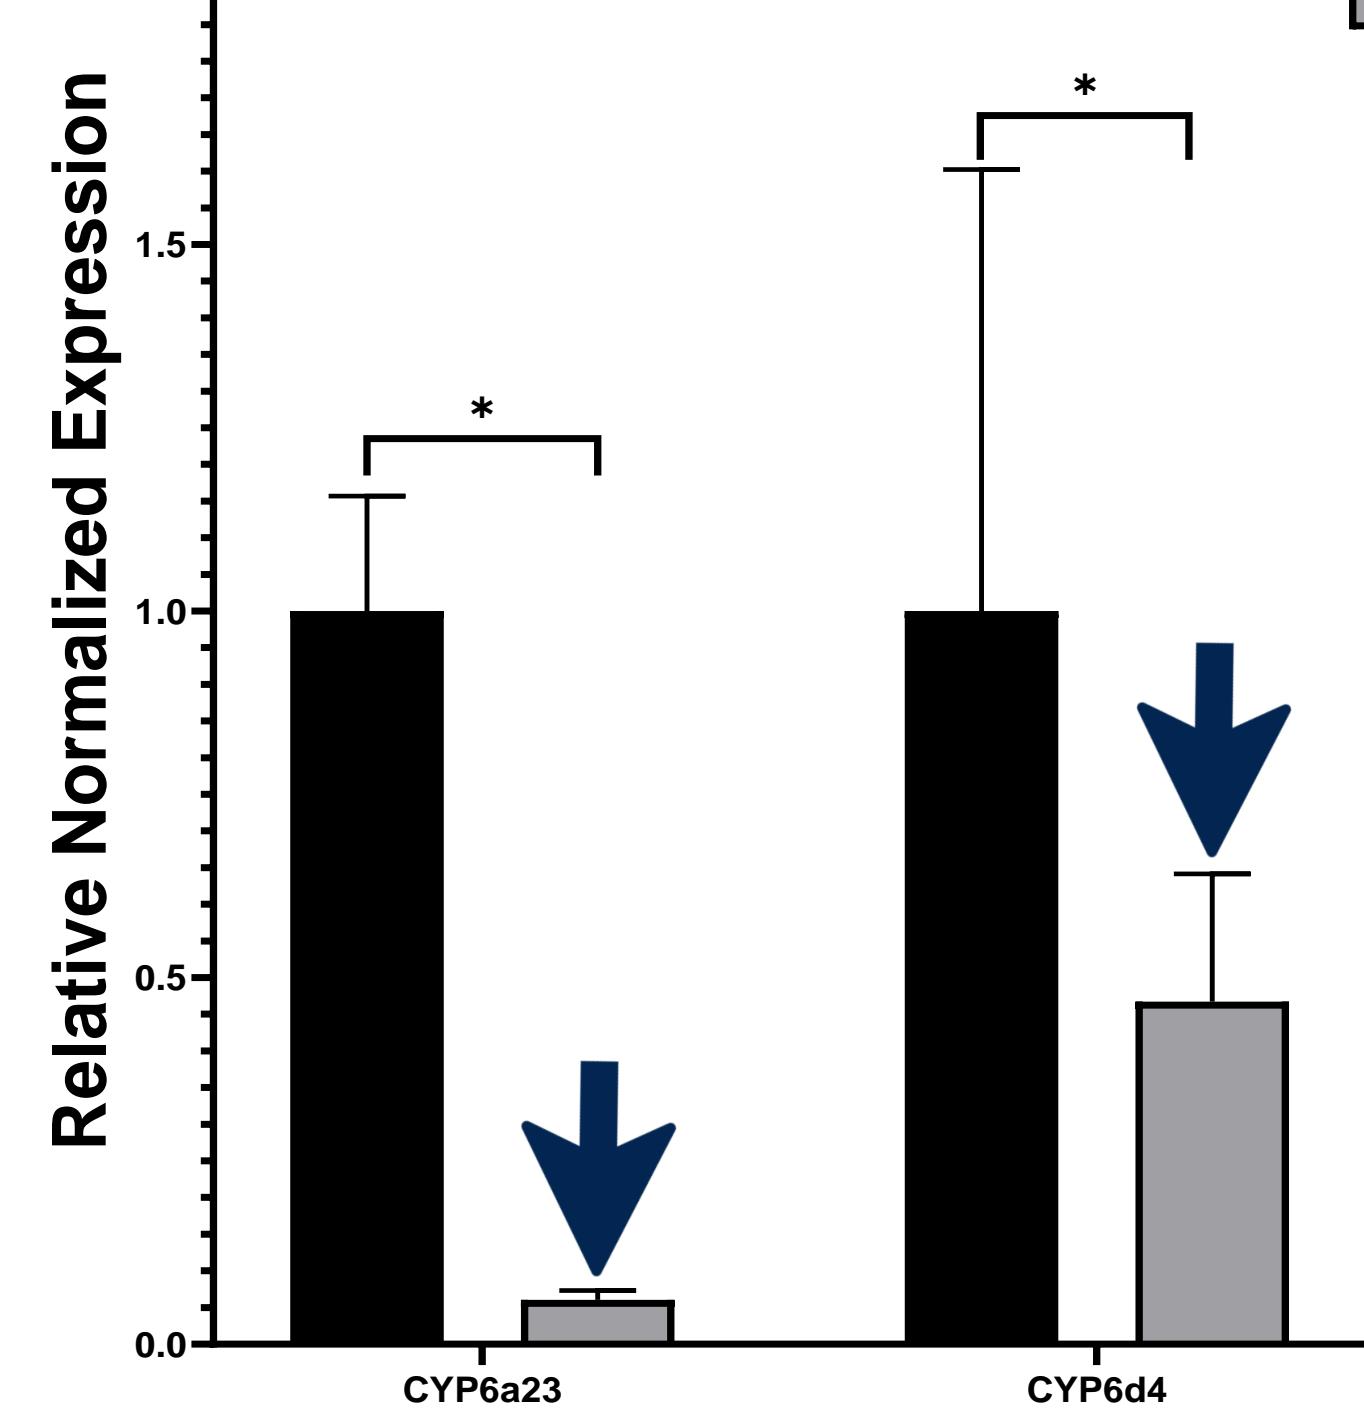

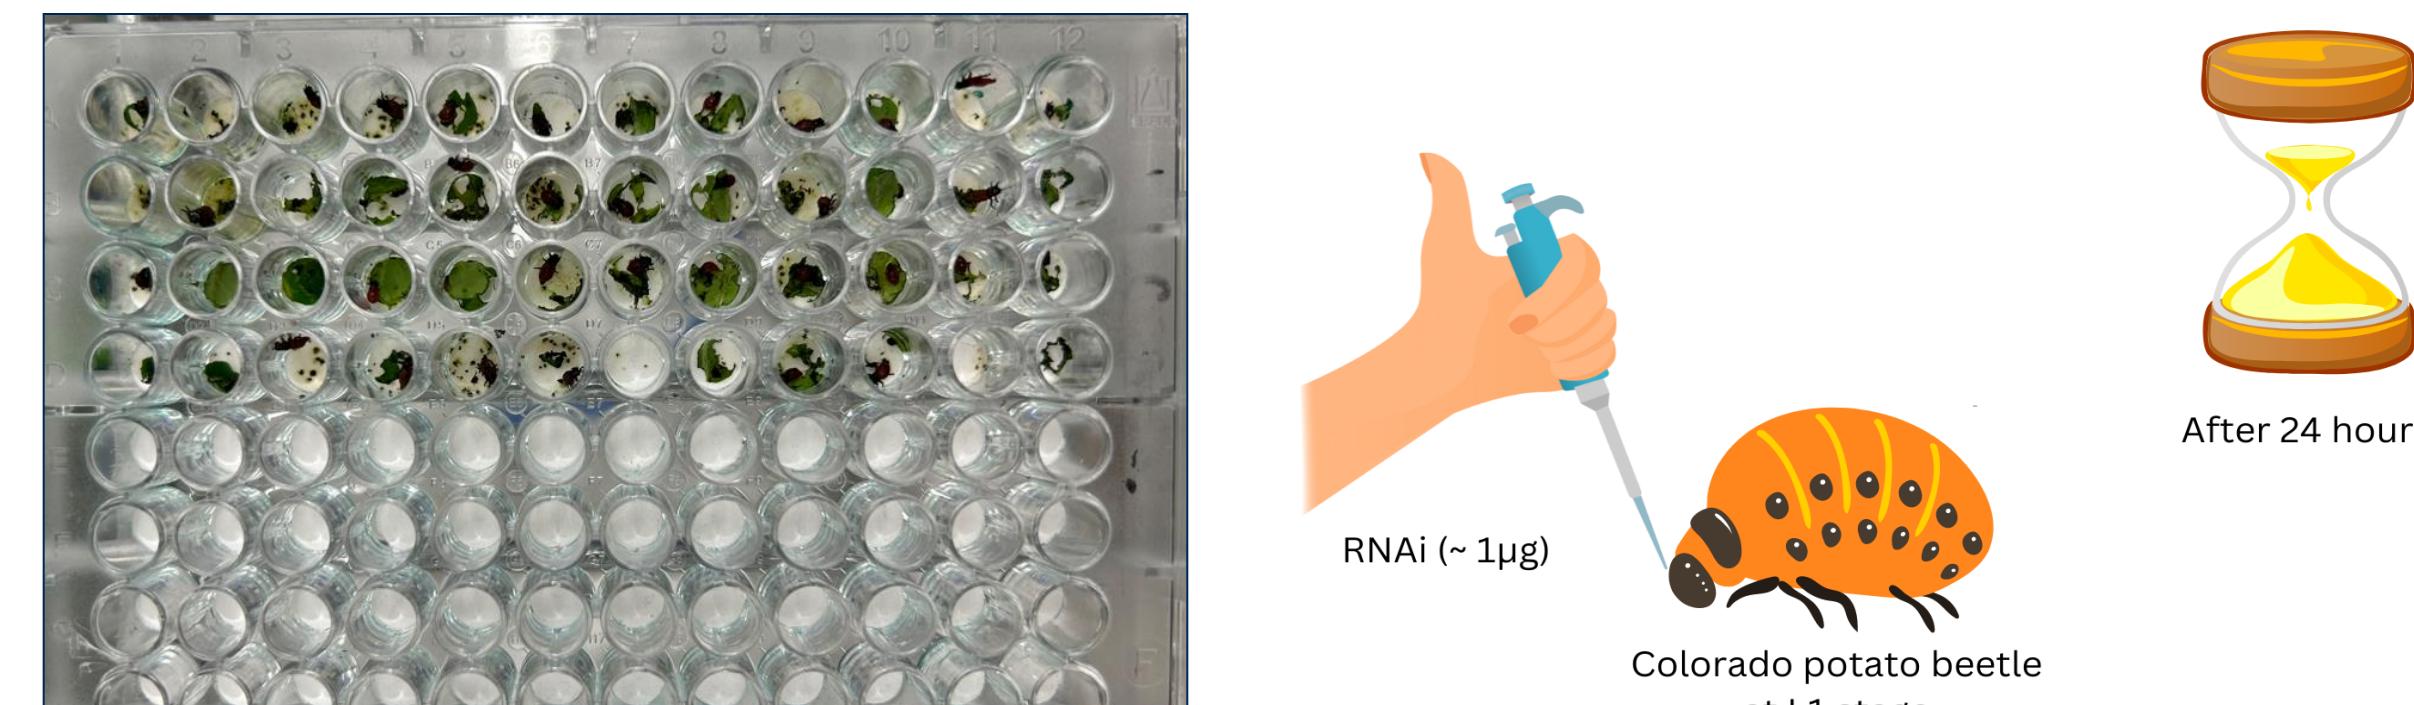

Expression profile of populations exposed to Delegate™ (5; spinetoram)

- Chemical group 3**
 - Matador®: 9 targets overexpressed
- Chemical group 4**
 - Actara® - CYP6a23 (**4.31-fold**)
 - Titan® - CYP6a23 (**7.14-fold**)
 - Sivanto Prime® - CYP6a23 (**6.06-fold**)
- Chemical group 5**
 - Delegate™ - CYP4g15 (**3.26-fold**)
 - Entrust™ - CYP9e2 (**4.95-fold**)
- Chemical group 28**
 - Verimark® - CYP6d4 (**2.08-fold**)
 - Coragen® **No** overexpression
 - Vayego® **No** overexpression

RNAi efficacy after 24 hours

1 laboratory susceptible population exposed to 1 µg of RNAi for 24 hours

RNAi-mediated decreases of:

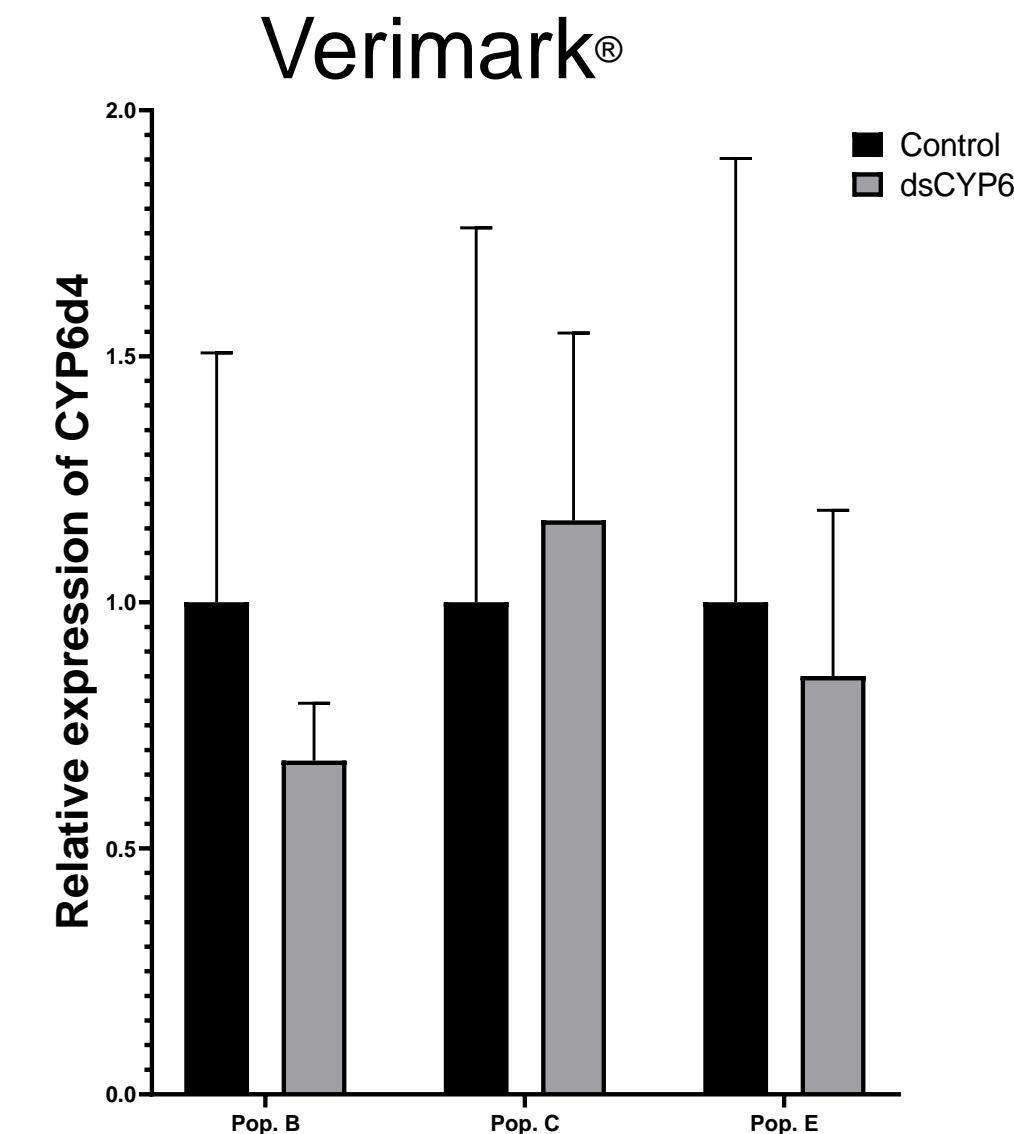

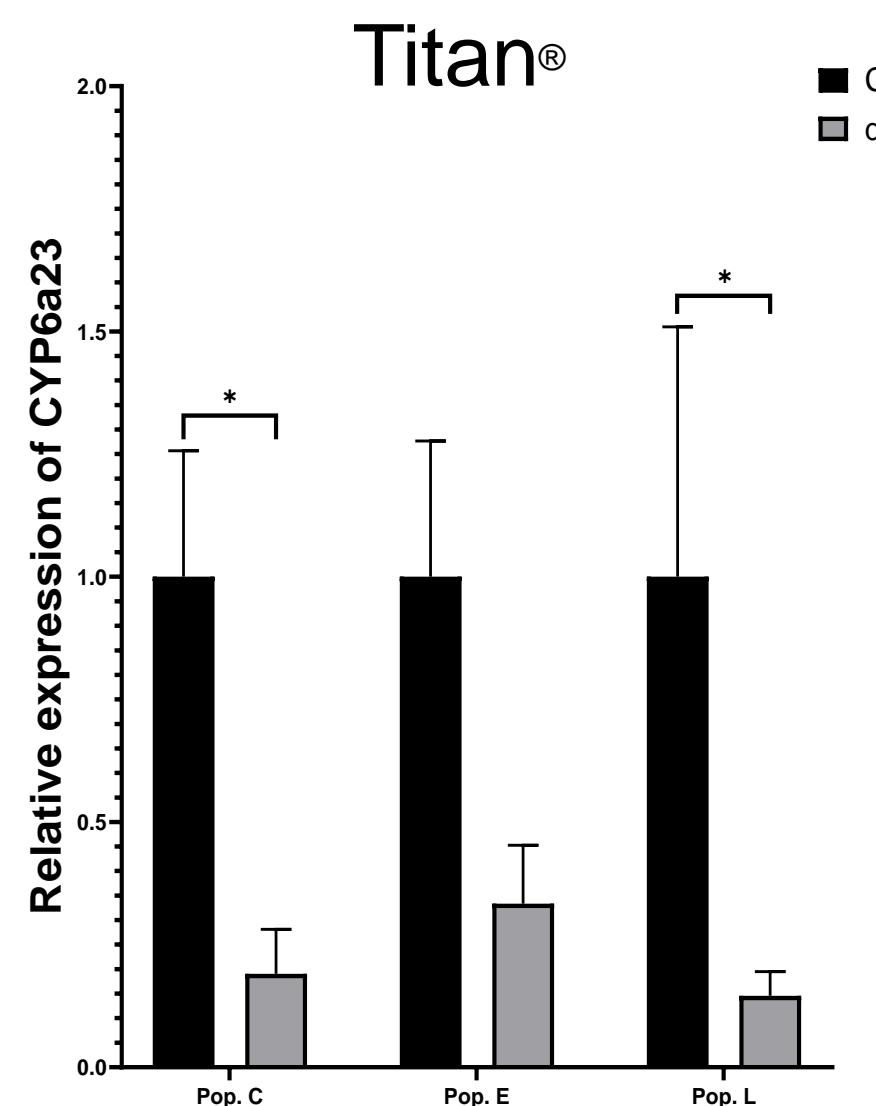

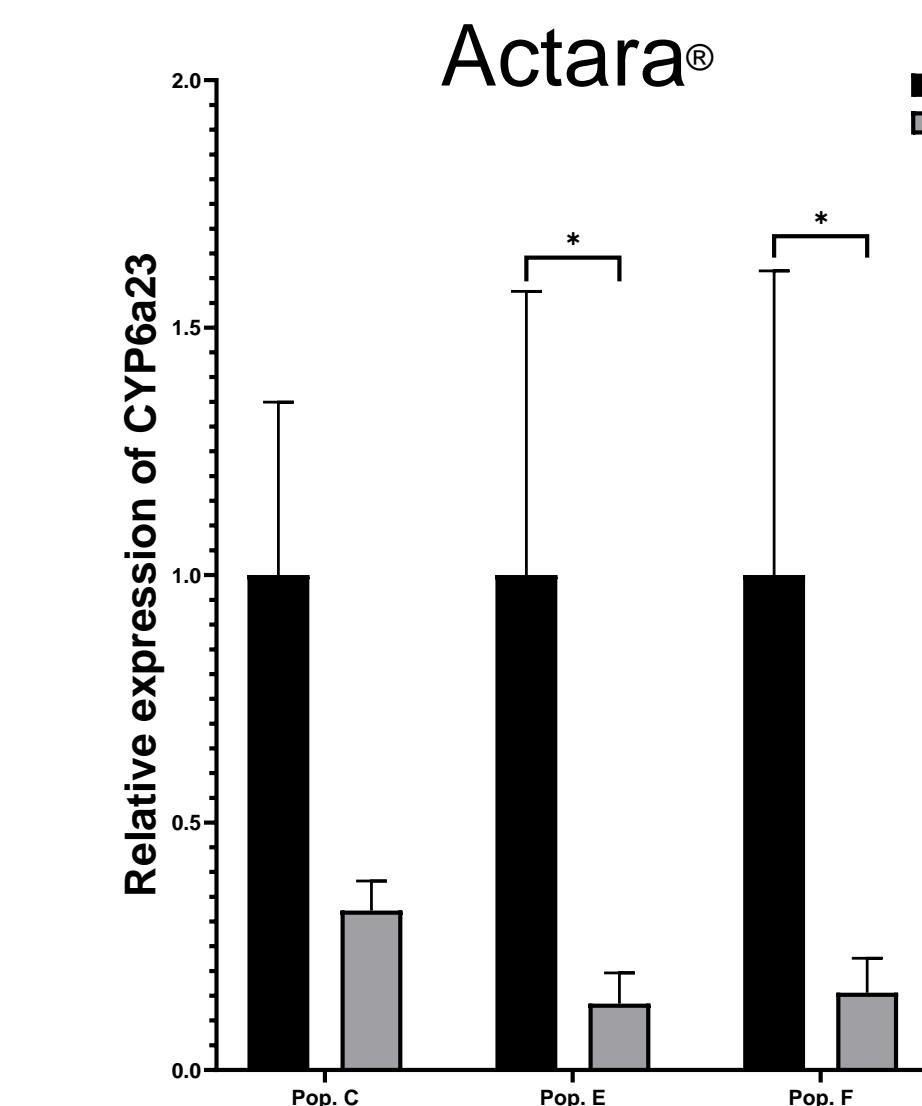

- CYP6a23 by **93.92 %**
- CYP6d4 by **53.24 %**

The same result was obtained after 48 hours.
A 24 hours exposure was preferred for the wild population exposure.

RESULTS

RNAi efficiency on resistant populations

3 wild resistant populations tested for each RNAi (5 pesticides from 3 chemical groups)

On average, RNAi decreased:

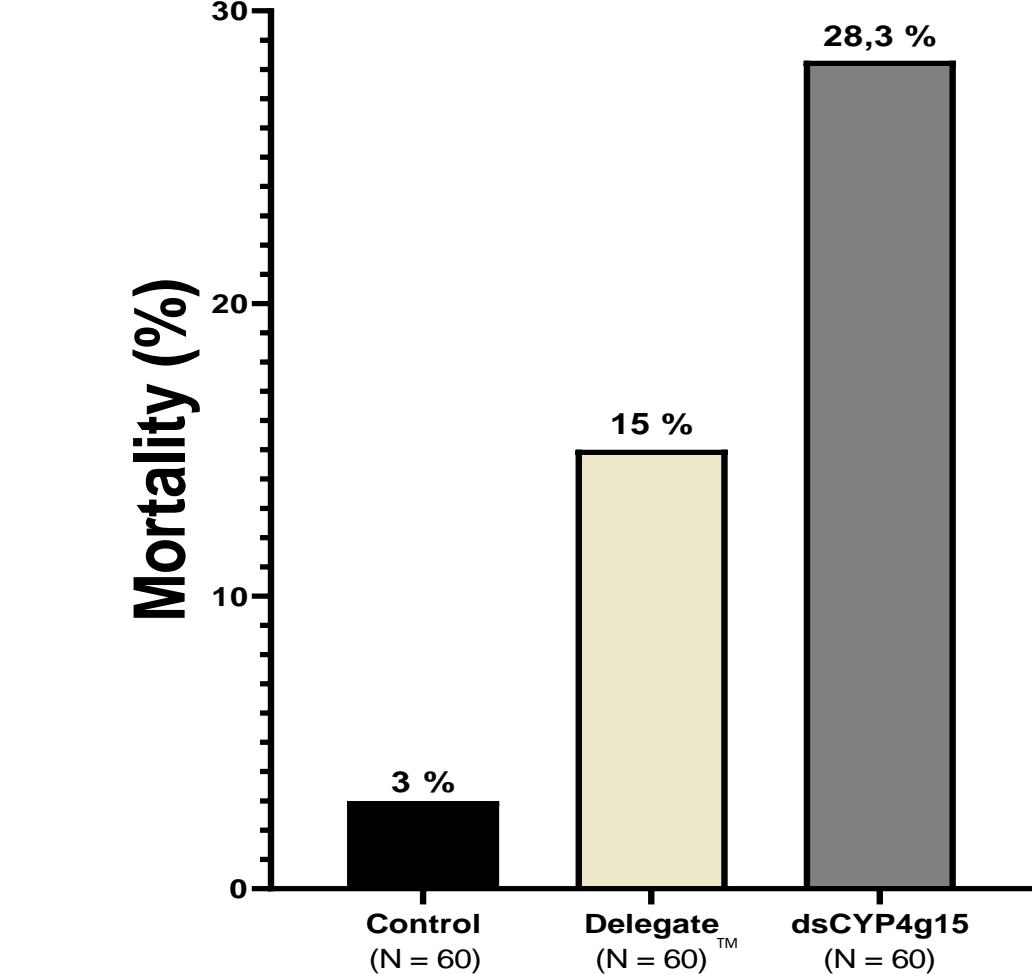

- CYP6a23 - Actara® by **79.59 %**
- CYP6a23 - Titan® by **77.66 %**
- CYP6d4 - Verimark® by **10.16 %**
- CYP4g15 - Delegate™ by **66.79 %**
- CYP9e2 - Entrust™ by **60.45 %**

Percentage of mortality

6 repetitions with 5 Colorado potato beetles each (Comparison between RNAi and pesticide).

Example of the impact of RNAi on larvae mortality (Pop. A)

RNAi increases larvae sensibility

TAKE HOME MESSAGE

- RT-qPCR identified detoxification genes according to populations and pesticides, offering clues for targeted control strategies.
- A 24-hour period with 1 µg RNAi seems optimal for genetic silencers.
- By targeting genes such as **CYP6a23** or **CYP4g15**, RNAi reduces resistance to chemicals, promoting integrated pest management strategies.

Acknowledgements

- Thanks to E. Twina and A. Martin for molecular biology help at the university of Moncton.
- Thanks to M. Wu for the statistical analyses, M.E. Jarry, F. Martin, A. Faigan, L. Seguy and A. Michaud for bioassays manipulations at IRDA.
- Thanks to agronomists with their producers for the wild strains.
- This project was funded by the Ministère de l'Agriculture, des Pêcheries et de l'Alimentation as part of component 2 of the Prime-Vert program.
