

THE LIFE CYCLE ANALYSIS OF WHEAT

Elisabeth Vachon
agronome
Les Moulins de Soulanges et La
Milanaise

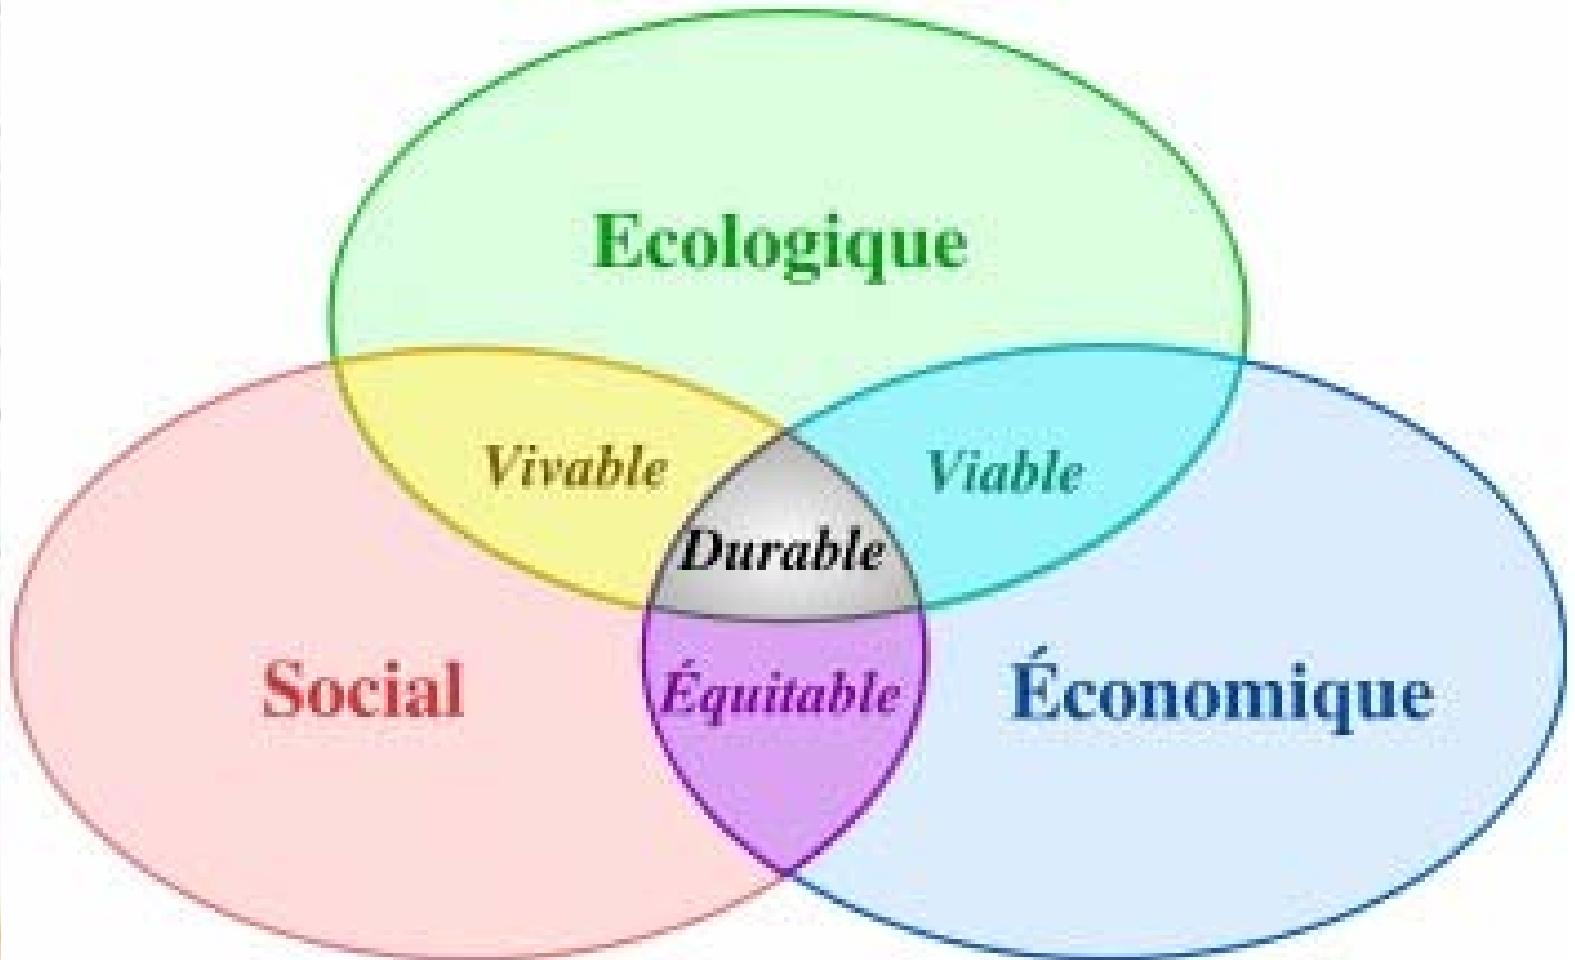

Historic of our pesticide free program with premium

- 
- Since 2007 (Agrinature = certification)
 - Since 2011 (Agriculture Raisonnée™ = trade mark)
 - Starting 2017 (Bonus for transitional wheat)

Sustainable agriculture approach

Social aspect

On farm research a win win approach

- ✓ Learn from experience
- ✓ Volunteer approach
- ✓ Tools to get results and more pesticide free wheat

UPA L'Union des producteurs agricoles

Québec

Analysis of the results

The minimum yield for organic equivalent is 2,0 t/ha.

Better margins for winter wheat.

Intensive crop system has the lowest margins.

The difference between Agriculture Raisonnée and conventional is small in regards to GHG but organic is the lowest.

Project impact on the farms

- 4 large scale farms switch to organic systems after the first year.
- The majority of the farms did not continue intensive farming methods.
- The premium and the market for Agriculture Raisonnée is an advantage for wheat producers.
- The project helped to demystify myths about organic production.
-

Objection to change

- Feeling of belonging
- Way of living
- Time for activities
- Resistance to uncertainty
- Marketing abilities

The project objective was not to convert farmers to organic but to put real number under each system.

Thank you!
